DTW allows us to recognize a pattern that could vary in size and length. To use this algorithm, we must use reference time series, which have to be selected by a human. The references must generalize well when compared with signals similar to the pattern in order to capture the whole range.

Stock Chart Pattern recognition with Deep Learning

I recently wrote an algorithm that uses an extremely dumb method to detect horizontal support and resistance levels within a short (90 minute) window, which confirmed that this is a very reliable signal when used with medium-volatility, low-volume stocks (penny stocks). Encouraged by those results, I tried to build on the concept with a new script that on the fly keeps track
