Control systems engineering requires knowledge of at least two basic components of a system: the plant, which describes the mathematically described behavior of your system, and the output, which is the goal you are trying to reach.

Buy an LM629 precision motor control chip for \$30. This chip does full PID control of position, velocity and acceleration. Requires ~15 lines of I/O to talk to it, and takes about 75-100mA of current just to run this chip. Need to design your own board to mate it to an H-Bridge circuit and a master processor
