Active. C57.113-2010 - IEEE Recommended Practice for Partial Discharge Measurement in Liquid-Filled Power Transformers and Shunt Reactors. Wideband measurement of the apparent charge of partial discharges (PDs) that may occur in liquid-filled power transformers and shunt reactors excited by ac test voltages between 40 Hz and 400 Hz are discussed. The major components of the PD measuring circuit including the calibrator are specified in compliance with IEC 60270.

IEEE Guide for Partial Discharge Measurement in Power Switchgear. Abstract: This guide defines methods of measuring partial discharges that may occur in energized power switchgear apparatus in flaws, voids, and interfaces of nonself-restoring insulation that may then result in dielectric failure of the switchgear. Guidance on instrumentation and calibration technique is also given.

What is Partial Discharge (PD) •An incomplete electrical breakdown between two conductors
•Corona is a type of PD, where the PD is occurring on a conductor surface and is the result of a high local (non-uniform) electric stress •Generally PD is only likely to occur on equipment operating at 3.3 kV phase to phase or above •PD is known to occur in power cables, stator windings, transformers and switchgear.

• Treatment of abnormal partial discharge: force the oil to circulate by using a submersible pump, and implement the PD test again until the oil cools naturally and release all the gas. It was found that the inception voltage remained but the PD magnitude was reduced to around 3000pC (half of the original magnitude).
